

Problem 1.41 (Russian Olympiad 1996)

Dec 06, 2020

upside down method

$$\angle EAF = \angle EDF = a$$

So, AEF D quadrilateral is cyclic.

$$180 - \angle ABC = \angle ADC$$

$$180 - (180 - b - \angle AEB) = \angle ADE + b + a$$

$$b + \angle AEB = \angle ADF + a \quad [\angle ADF = \angle ADE + \angle EDF = a]$$

$\angle EDF = \angle AEB$ cyclic quadrilateral property

$$b + \angle AEB/x = \angle ADF/n + b$$

\therefore ABCD quadrilateral is cyclic

$$\therefore \angle BAC = \angle BDC$$

$$\therefore \angle BAC - b - a = \angle BDC - b - a$$

$$\therefore \angle FAC = \angle EDB \quad \square$$
